COMPOSITE ARCHITECTURAL BEAMS

SIGNATURE  
COLLECTION

# High performance for high expectations.

Lifespan hybrid aluminium composite beams give you the creative freedom to build more memorable outdoor architectural designs. These multi purpose beams have the functionality, resiliency, and beauty to make your project remarkable. Whether you choose to use Lifespan beams for pergolas, entryways, dramatic screening, or your own creative architectural vision, revel in the feeling of building something truly innovative.

## Designed for the future

The architectural design emphasises curved, layered custom-designed roof segments, with clerestory windows that admit natural ambient light from the shaded rainforest. Landscaping was designed to complement the gallery building with verdant planting and carefully maintained tree species, drawing attention to the deck and reflection pond.

Movable screens and partitions were positioned to highlight simple, raw materials over a prefabricated steel structure to accentuate the environmentally friendly construction, which was intended to nestle into the surrounding landscape. Special features include high arches, a curved steel structure, clearstory curved glazing and the cantilevered deck.

## KEY INFLUENCER QUOTE

"The client is extremely happy with the finished gallery and the way it complements the rest of the existing lodge in this pristine natural area."

# Engineering architectural excellence

The design is as beautiful as it was ambitious, and Modern Age Design were tasked with sourcing sustainable solutions to achieve this architectural masterpiece. "The brief was to look and feel as natural as possible," says Hein Jansen from Modern Age Design, who built and installed the structural high-pitched window arches, pergola, gate and screens featured around the building.

Lifespan's lightweight beams and balusters are engineered for easy overhead installation, dimensional stability and outstanding wear characteristics. The textured polymer outer coating prevents scratches, scuffing and splintering, as well as preventing damage or deterioration from pests, mold or mildew.

## KEY INFLUENCER QUOTE

"Eva-Last were extremely helpful in bringing this project to life. Their products allowed us to achieve the soft, natural timber finish we wanted, but with the confidence that they won't compromise the structure's integrity, would weather well and look the same as the day they were installed."

## Sculpted for convenience

The contemporary structure was sculpted for elegance, with a slightly slanted roof featuring a slatted wraparound screen made from Lifespan bamboo composite beams for protection from the afternoon sun. The UV-resistant composite beams in Savanna's earthy, natural shade creates an organic skin around the building that is both sculptural and functional, softening the façade while ensuring long-lasting durability.

KFC The Wedge's front-of-house, which focuses on the digital terminals for walk-in customers to order meals, made use of Lifespan to lower the ceiling with a hanging garden and complete the warm wood-look interior.

## KEY INFLUENCER QUOTE

"When designing and specifying materials for franchisors, we always have to consider costs, maintenance and durability."

"Lifespan's authentic wood-look appearance, weather-resistance, structural stability and environmental credentials delivers on all three counts."

*Thomas Kriel, Lead Designer*

## **Pergolas**

# Radisson RED Hotel Parks Precinct

Gauteng, South Africa

# Sculpted for convenience

As a brand, Radisson RED has a stated commitment to sustainable design. This is in keeping with the development requirements of the Oxford Parks precinct, which mandates all construction within the zone to adhere to a minimum five-star Green Star rating.

Eva-Last supplied composite pergolas for the seventh-floor outdoor terrace, which features a swimming pool, terrace bar and gym. While being selected for the products' aesthetic appeal and sophisticated design appeal in this prime location, Eva-Last's pergolas are required to maintain their attractiveness while withstanding Johannesburg's harsh weather, with no signs of discolouration, fading, cracking or warping.

## KEY INFLUENCER QUOTE

"This was the design intent from the interior architects, who selected the product and design based on their vision. Eva-Last was chosen due to the durability and low to no maintenance requirements of the product. The products matched the design intent from look and feel, to incorporation of light spaces. The deck was also used to house the pool pumps, which was a clever design initiative. We are satisfied with both the aesthetics and lack of wear and tear apparent from the products."

## Aesthetic value the key differentiator

Eva-last products have been selected by residential property owners throughout the estate, reinforcing Steyn City's architectural and aesthetic character. According to Steyn City architects, the choice of Eva-last products was due to their versatility of application and extensive colour range with the most natural timber look.

The quality and durability of Eva-last's products will ensure a consistent look and feel for decades to come – benefits include UV resistance, water resistance and slip resistance, all of which are ideal for the Steyn City lagoon application.

#### KEY INFLUENCER QUOTE

"Specifying Eva-last's product was an easy decision. From the versatile and highly adaptable product range, to the performance properties and aesthetic quality which is offered in the most exciting colour range, Eva-last provides a complete package. All the components, including the fasteners, and installation and after-sales service is superior, high-quality and long-lasting."

# The Rubik

Cape Town, South Africa

## A tall order for a stunning city skyline

This multi-storey monolith, designed by award-winning architects DHK, features an ingenious rotating core and various mixed modern building materials including concrete and glazing were used on the exteriors, with reflective floor-to-ceiling windows on the upper volume optimizing sunny South Africa's fabulous climate. A combination of pre-cast concrete with brickwork and aluminium fin infills were retrofitted to the existing lower plinth – an aligning, unifying 'nod' to the neighbouring buildings. Soft, natural design elements with the latest material technology were introduced in the minimalist interiors.

A warm, welcoming reception on the ground floor and breathtaking rooftop entertainment area tops the block for the ultimate luxury in modern city convenience.

The result is a distinctive, dynamic form with the necessary scale and structure within the heart of the city's centre.

#### KEY INFLUENCER QUOTE

"Eva-Last's natural-looking materials add to the aesthetics of The Rubik, introducing a more natural and warmer interface, breaking away from the monolithic structure of the building,"

"Their eco-friendliness, low maintenance properties and durability were also key considerations in their specification"

*Lucienne Myburgh, Snr Architectural Technologist  
DHK*

# Creating a striking new twist

The Johannesburg Central fire station was completely revamped as a landmark of modern design and development. The precinct was designed for low maintenance and sustainability, complete with state-of-the-art facilities, a Public Safety training centre and an extensive outdoor leisure area using the latest high-performance materials.

Eva-Last's lightweight Lifespan architectural beams were specified for the pergolas and screens in the parking areas and walkways. These striking architectural features have created shady breezeways in natural wooden tones, providing an attractive, easy-care structure that can withstand heat or water without the constant upkeep.

## KEY INFLUENCER QUOTE

"We really wanted to create a striking, worry-free facility for our firemen to facilitate prompt and efficient service".

"The wood-look pergolas and screens created by the Lifespan beams provide just that".

"With the Lifespan beams, they can enjoy the timber texture and reinforced stability without having to worry about the safety and security, or sustainability and maintenance of their workplace".

## Smart choices

Eva-Last's Lifespan architectural beams were selected for the wraparound screening. These lightweight, low maintenance hybrid aluminium bamboo composite profiles provide a realistic wooden appearance with the necessary structural strength and dimensional stability required to support the signage.

Furthermore, Lifespan's hollow aluminium core was ideal for the overhead installation, over the extended span of the floating roof and wraparound. Supremely strong and durable, but lightweight, its hollow core provides the structural reinforcement needed to secure the steel bracket that was attached for each store's signage. Lifespan's hidden fastener system allowed for fewer bolts delivering a seamless finish which goes largely unnoticed against the steel structural columns.

Lifespan architectural beams – in Eva-tech surface technology – were selected in Savannah colour. The 10-year warranty on this technology means the product will not discolour or degrade over time, offering superior resistance to corrosion and biodegradation, no matter the climatic conditions.

#### KEY INFLUENCER QUOTE

"The ornamental screens create an iconic feature at the Tableview Shopping Centre that is both decorative and functional. It adds a welcoming natural aesthetic to the building while serving as an attractive billboard for signage and helping customers orientate themselves."

*Gareth Teague
